

MOSQUITO DUNKS®

kill mosquito larvae in the water garden & other standing water around the home before they are old enough to bite.

Water gardens and Ponds

Rain Barrels

Clogged Gutters

Old Tires

Flower Pots

Tree Holes

Bird Baths

Dunks Work!

Dunks Are Simple!

General Information

After placing dunks in mosquito breeding grounds, you will see the adult population slowly diminish. This control method seems slow but it does give long-term control over a potentially dangerous insect. It could take up to two weeks to actually see the results of this product. If quick elimination of mosquito larvae is desired, first use Mosquito Bits. This is another "BT product" which works by the same mode of action as Mosquito Dunks.

Mosquito Dunk Biological Mosquito Control

Active Ingredients: Bacillus thuringiensis 10.00% These bacteria will not hurt pets, children or wildlife.

Each dunk kills mosquito larvae for 30 days or more. Mosquito Dunks float on water and will keep on working for 30 days or longer under typical environmental conditions. While floating, they slowly release a long-term, biological mosquito larvicide at the water's surface. This larvicide gradually settles in the water where it is eaten by mosquito larvae growing there. Mosquito Dunks may be used in all types of standing water sites where mosquito larvae grow. Alternate wetting and drying will not reduce their effectiveness.

Directions

Use one Mosquito Dunk for up to 100 square feet of water surface, regardless of water depth. To prevent them from being washed away, the dunks can be anchored using a string tied through the center hole or they can be staked in place. For smaller areas (flower pots, bird baths, pet water bowls,) Mosquito Dunks can easily be broken into smaller pieces.

Suggested Amounts to Use:

1 to 5 square feet	¼ Dunk
5 to 25 square feet	½ Dunk
25 to 100 square feet	1 Dunk

Mosquito Dunks are available from the Henry County Health Department:

Pack of 6 dunks -- \$10.00
